*submission submitted to the EMBL Data Library, July 1995
*description Male germ cells from several mammallan species express a
specific repertoire of olfactory receptor genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  $68129 *type complete

l:part1 2:part2 3:part3 4:part4 5:part5 6:part6 7:part7
8:part8 9:part9 10:part10 11:part11

Mean 47.899; Variance 90.096; scale 0.532 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

THE STATE OF THE S

```
-1. CATALITIC ACTIVITY: APP + H(2)O = ADP + UNTHURHUGE HALL.
-1. SUBUNIT: POSSIBLY EXISTS AS AN HOMODIMER OR AN HOMOTRIMER.
-1. SUBCHLUARA LOCATION: INTEGRAL MEMBRANE PROTEIN.
-1. AS MANY AS 6 TO 8 CLOSELY RELATED GENES MAY ENCODE OTHER ISOFORMS OF PLASMA MEMBRANE ATPASE IN TOWATO, LIKE THE LHAI GENE PRODUCT WHICH IS 96% IDEWTICAL TO THE LHAZ GENE PRODUCT.
-1. SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (EL-EZ-ATPASES).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BACILLUS FIRMUS.

Mean 9.460; Variance 6.196; scale 1.527 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N RITHLETL protein receptor B - for diagnosis and treatment of the sequence was derived from the DNA encoding natriluretic peptide.

The sequence was derived from the DNA encoding natriluretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein the become sequence was derived from the DNA encoding natriluretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein the protein.

The sequence was derived from the DNA encoding natriluretic peptide of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-NPRB analogues). The protein (or variants) can be used in treatment of natriluretic peptide disorders, and also to isolate peptides using confinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1062 GAACATCACTGGGATGGTGCTTGTGGTCATACGCGAGACAGTCCCGTGTAGAAGGCCA 1003

Claim 3; Fig 1; 4Pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein finase activity. The DNA can be inserted into expression vectors for the prodon. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952).

The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using also be prepd.
                                                                                                                                                                                                                                                                                                           09-APR-1991 (first entry)
Human Natriuretic Peptide Receptor B.

Oligonucleotide probe MX14 consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 057735-45 and 051747-59.

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Random point mutations were introduced into the alpha fragment of E-coll beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonuclectide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3 and generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 89 ttthhyrrmrbnvyrdynrsdaawyccyrrsvkydccynachhddhyvybbbvynvhnh 148

Estandom point mutations were introduced into the alpha fragment of
E.coli beta-qalactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29 ayrccbgcaggycgacbcyrraggnyccccggggywccgagcycgaayycdchygccgymr 88

```
Tidentifying proteins or peptide(s) which bind a ligand - by recening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain.

Tomprising a binding domain and an effector domain.

Disclosure: Page 35; 255pp; English.

O70467 is a generic DNA sequence used to generate random TSAR (Totally synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)16/TGC) (NNB)16/NNB)16/TGC) (NNB)12. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in R5151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with septide peptide sext two functional regions - a binding domain with a fightity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oliqonicalcides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs confer some degree of conformational rigidity to the peptides. The TSARs confers one degree of conformational rigidity, eg. metal ion,

TSAR, totally synthetic affinity reagent; synthetic; binding domain; effector domain; concatenated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
it to generate a popn of DNA molecules which terminate at all possible nuclectide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nuclectides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a sultable host-vector system. The sequence covers all 176 difft base substitutions, most of which see also P80575.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Friends Roberts Formula and an effector domain by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English effector domain and an effector an also be compensated as follows: X(NUB) [CTCC] (NUB) [
                                                    the need for
radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromicentes, est monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                    ö

PT Trible Robinson or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; page 35; 255pp; English experses this generic formula can also be comprehence as fallinity Rangents! Deptides: This generic formula can also be comprehence as follows: X(NNB)lf(TGC)(NNB)52(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in 070466-68. Comprehence are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with comprising at least two functional regions - a binding domain with a fifthity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker operative between the 2 domains. The oligonuclectides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues positioned in, or flanking, the unpredicted or variant residues positioned in, or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, redisotope, peptide, toxin or enzyme, to the specific target or on the conclosal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody monoclonal or polyclonal antibodies and enced and have designed activity sequence 114 BP; 0 A; 2 C; 2 G; 2 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain comprising a binding domain and an effector domain by screening a binding domain and an effector domain comprising a binding domain and an effector domain bischouse; Page 35; 255pp; English.

50,04666 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows:X(NNB)1(GC)(NNB)10(TGC)Z(NNB)4Z(NNB)6 (TGC)(NNB) (TGC)Z(NNB)10(TGC)Z(NNB)4Z(NNB) (TGC)(NNB) (TGC)Z(NNB)10(TGC)Z(NNB)4Z(NNB) (TGC)Z(NNB) (TGC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The TSARs or compsis. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or ensyme, to the specific rarget or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 4 G; 4 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
The fleatifying proteins or periode(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins or periode as comparison and an effector domain proteins or periode as 5: 255pp; English.

Condition a generic DNA sequence used to generate random TSAR (Totally Statestor Affailty Reagents) peptides. This generic formula can also be represented as follows: X(NNB) G(TGC) (NNB) 14 (TGC) (TGC) (NNB) 14 (TGC) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            326 CCCGGAGAGCAAGAACGGCGGCAGCCCGGCGCTCAACAACAACAGGGGAGGAGCGGCAG 385
Generic DNA sequence to generate a random TSAR petide library.
TSAR; totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                070469 standard; DNA; 114 BP.

PT Gentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins or pertifying proteins and an effector domain

By Screening a recombinant vector library expressing fusion proteins

By Screening a binding domain and an effector domain

By Screening a binding domain and an effector domain

By Staclosure; Page 35; 255pp; English: This generic formula can also be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This generic formula can be represented as follows: X(TGC)(NNB)10-

This generic formula can be represented as follows: X(TGC)(NNB)10-

Sites (X is not the same as Y) that are not specified further. This site is not the same as Y) that are not specified further. This can establish are cloverled in structure. Other sequences are shown in R61810-54. Takks are concatenated by these generic sequences are shown in R61810-54. Takks are concatenated heterofunctional proteins or peptides. Comparising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide continuals 2 or 4 dysteine residues positioned in, or flanking, the upredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or in conformation of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma conformation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Screening a recombinant vector library expressing fusion proteins

Comprising a binding domain and an effector domain

Disclosure; Page 35; 255pp; English.

Of0466 is a generic DNA sequence used to generate random TSAR peptide

This generic formula can be represented as follows: X(TCC)(NNB)10-

This generic formula can be represented as follows: X(TCC)(NNB)10-

(TGC)(NNB)6Z(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction

sites (X is not the same as Y) that are not specified further. This

sequences are shown in Q70465-68. Other specific peptides

generated by these generic sequences are shown in R6150-54. TSARs are

concatenated heterofunctional proteins or peptides, comprising at least

two functional regions - a binding domain with affinity for a ligand and

a second effector peptide portion that is chemically or biologically

active. They may further comprise a linker peptide between the 2 domains.

The oligonucleotides are also designed so that the expressed peptide

conformational rigidity to the peptides. The TSARs or compsis.

TSAR binding domain can be used in vivo to deliver a chemically or

or enzyme, to the specific target or on the cell. They can also replace

the function of macromolecules, eg. monoclonal or polyclonal antibodies

conformation or in vivo antibody production. The TSARs are easily

charecterised and have designed activity allowing direct and rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; Page 36, 255pp; English.
